AP

## Up And Away

Larry Walters, sitting in his lawn chair, appears a bit concerned as he watches his last tether line break, shooting him skyward over California. Walters and his 45 weather balloons soared 16,000 feet high, exciting two jetliner pilots.

Associated Press

Larry Walters lugs craft past police car after landing in Long Beach.

## PILOT: Aloft in a Lawn Chair

Walters was able to drop to the ground a few feet below his lawn chair.

As he was coming down over the roofs of Long Beach, he said, "I was saying prayers to God to please let me down in one piece."

He was jettisoning equipment as he came down—including his pellet gun, life jacket and radio.

When he came back to earth about 11:45 a.m., his face was sunburned a bright red and Walters was tired but exhilarated. "I have fulfilled my 20-year dream," he announced.

Did he plan to go up again?

"I'm staying right on the ground, yes ma'am. I proved to myself that the thing does work."

The Federal Aviation Administration took a less happy view. "We know he broke some part of the Federal Aviation Act," regional safety inspector Neal Savoy told the Associated Press, "and as soon as we decide which part it is, some type of charge will be filed."

But Lt. Reed of the Long Beach police shrugged. "There probably won't be any action taken," he said, "basically because there is nothing that covers something so unorthodox."

```

Ok, so?

CONSTRAINTS

No, really, constraints.

Can't write to disk

Immutability

Immutability

Less uncertainty

# Immutability

Easy(er) to reason about

Support only one OS

You only need one

Support only one OS

(probably) Works on prod

Support only one OS

Don't need plenv/brew

Define your entire stack

Infrastructure as code

Define your entire stack

Explicit dependencies

Define your entire stack

Works on 'dev' machine

Define your entire stack

Integration first

Define your entire stack

Infrastructure as code

Define your entire stack

Try Perl 5.26 today

# Infrastructure as code

New dev?

`docker-compose up`

docker-compose up

My laptop can burn

1 container, 1 process

1 process, 1 service

1 process, 1 service

Explicit communication

1 process, 1 service

Better architecture

1 process, 1 service

Look Ma! Microservices

1 process, 1 service

Each service it's the king

# Only Linux?

?

Remember  
Larry?

Why is relevant?

IT'S AWESOME

Why isn't everyone  
talking about this?

Constraints are good

TIMTOWDY

Deployments are hard

Thanks

# Questions?

(And apologies for the lack of kittens, you should have asked for it)
